SITE RELIABILITY ENGINEER | DEVOPS ENGINEER | LINUX PRODUCTION SUPPORT

Results-driven Site Reliability Engineer / DevOps Engineer with 9+ years of experience in Linux production support, deep troubleshooting, monitoring, automation, and reliability engineering for enterprise applications. Strong expertise in incident management, root cause analysis (RCA), observability, CI/CD troubleshooting, migration support, and operational automation in high-availability production environments.

Experienced in resolving complex production incidents across Linux servers, Java microservices, application services, deployment pipelines, and monitoring platforms while focusing on reducing MTTR, improving uptime, and enhancing operational efficiency. Skilled in Bash scripting, monitoring tools, deployment validation, migration operations, and production reliability aligned with SRE principles including SLIs, SLOs, alerting, automation, and operational excellence.

Experience

OCT 2021 – PRESENT

Senior Specialist | HCL Technologies

Key Responsibilities & Achievements

- Managed production support and reliability operations for enterprise applications running in high-availability environments.
- Improved application uptime to 99.9% using proactive monitoring, alert optimization, and observability solutions including Grafana, Nagios, Datadog, and Prometheus.
- Led critical incident troubleshooting across Linux servers, Java microservices, application services, Jenkins pipelines, and monitoring platforms, reducing MTTR by 30%.
- Performed deep log analysis using Kibana, Linux utilities, and monitoring dashboards to identify root causes of production incidents.
- Automated operational tasks using Bash scripting, reducing manual workload by 40% and improving operational efficiency.
- Collaborated with development, QA, infrastructure, and engineering teams to resolve recurring production issues and improve application reliability.
- Created and maintained monitoring dashboards, alerting mechanisms, and health checks for proactive incident detection.
- Participated in on-call support, release validation, migration activities, and incident management aligned with SRE operational practices.
- Mentored junior engineers on Linux troubleshooting, monitoring tools, and production debugging methodologies.

Data Center Migration & Production Go-Live Support

- Played a key role in a critical Data Center (DC) migration initiative involving monitoring and validation of 1000+ application instances and Java microservices in production environments.
- Supported deployment and migration activities across large-scale distributed systems, ensuring successful code deployments and service readiness during migration windows.
- Collaborated closely with Infrastructure, LME, Engineering, and Application teams to validate instance health, configuration consistency, service dependencies, and production go-live readiness.
- Performed proactive monitoring, troubleshooting, and post-deployment validation during migration activities to ensure minimal downtime and service stability.
- Assisted in identifying and resolving migration-related configuration, deployment, and application availability issues across environments.
- Contributed to high-availability migration operations by ensuring services were properly configured, monitored, and operational before production cutover.

JUL 2016 – OCT 2021

Technical Support Engineer | Tata Consultancy Services

Key Responsibilities & Achievements

- Provided L2/L3 production support for mission-critical enterprise applications in a 24x7 support environment.
- Monitored application and infrastructure health using Datadog and internal monitoring platforms to ensure service availability.
- Troubleshot production incidents using SQL queries, Linux commands, application logs, and debugging techniques.
- Reduced recurring incidents by 25% through detailed RCA analysis and collaboration with development teams.
- Supported release management, deployment validation, environment checks, and issue triaging during production releases.
- Participated in migration initiatives from legacy systems to microservices architecture, improving scalability and maintainability.
- Created troubleshooting documentation, operational runbooks, and knowledge-sharing materials for support teams.
- Conducted internal training sessions on incident management, monitoring practices, and production troubleshooting workflows.

Technical Skills

Linux And Production Support

Linux Administration, Production Support (L2/L3), System Troubleshooting, Incident Management, Root Cause Analysis (RCA), Service Recovery, Log Analysis, Performance Troubleshooting, Deployment Validation, System Health Checks

Monitoring & Observability

Nagios, Prometheus, Grafana, Datadog, Kibana, Alerting, Dashboarding, Metrics Analysis, Application Monitoring

Automation & Scripting

Bash/Shell Scripting, Cron Jobs, Linux Utilities, Operational Automation

DevOps & CI/CD

Jenkins, Git, GitHub, CI/CD Pipelines, Argo CD (Learning)

Cloud & Application Technologies

AWS (Basic), SQL Querying, Java Debugging, Java Microservices Support

KEY AUTOMATION & RELIABILITY PROJECTS

Docker Instance Roll Automation

- Developed automation tooling to perform rolling restarts of Docker instances during migration activities for rapid testing and validation before production go-live.
- Reduced manual operational effort from 2 hours to 30 minutes through automated rollout and service validation processes.
- Improved migration efficiency, deployment validation, and rollback readiness during production migration windows.

Configuration Validation Automation

- Developed a configuration validation utility to detect missing or inconsistent configuration files during instance migration across data centers.
- Automated comparison of configuration files between source and target environments to ensure migration consistency.
- Improved operational efficiency by 25% while reducing configuration-related post-migration incidents.

Load Balancer Health Check Automation

- Created automated health-check tooling to validate load balancer and backend instance availability during migration activities.
- Reduced manual validation effort by 30% while improving reliability and faster issue detection during production cutover windows.
- Enabled proactive troubleshooting for traffic routing and application accessibility issues.

Education

Master of Computer Applications (MCA)

6.0 GPA • Amity University | 2016 – 2020

Bachelor of Computer Applications (BCA)

8.5 GPA • Manav Rachna International University | 2013 – 2016
